Honey Bee
Life Cycle

Egg Stage

The life of a honey bee starts when the queen bee lays an egg. She lays each egg in a tiny cell within the honeycomb. The egg is very small, white, and shaped like a grain of rice.
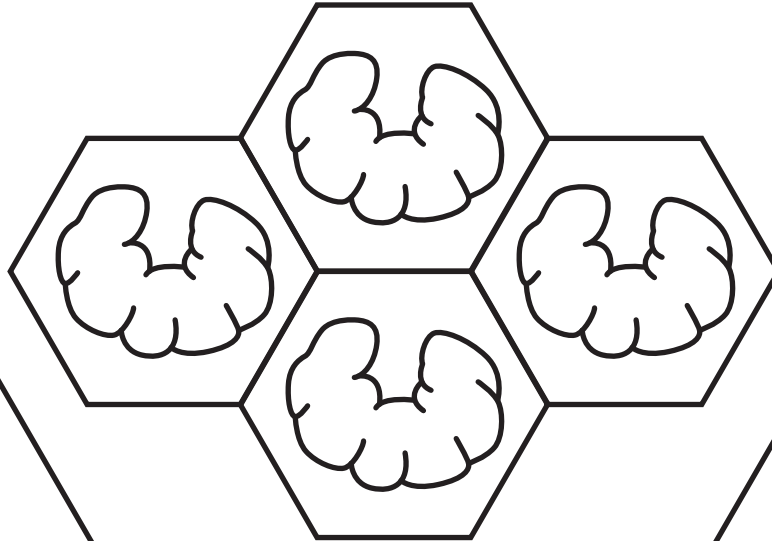

Larva Stage

After about three days, the egg hatches into a larva. At this stage, the larva looks like a small, white worm. Worker bees feed the larva a special substance called royal jelly, which helps it grow quickly.

Pupa Stage

After about three days, the egg hatches into a larva. At this stage, the larva looks like a small, white worm. Worker bees feed the larva a special substance called royal jelly, which helps it grow quickly.
Adult Bee Stage

After about a week, the larva spins a cocoon around itself. Inside the cocoon, it transforms into an adult bee. This stage is called the pupa stage. While inside the cocoon, the bee undergoes many changes, developing its wings, legs, and other body parts.
